

Slide Executive - Working in a team

Novatrox has two products that provide help when working with Microsoft PowerPoint presentations; Slide Executive Desktop and Slide Executive Professional. Slide Executive Desktop is primarily intended for single users, to help individuals index, search and create new presentations that are located on their own computer or on a share nearby. Slide Executive Professional is intended for larger groups that need to collaborate with extensive amounts of presentations and slides.

Slide Executive Desktop

Although the Desktop edition is intended for the single user, it can work for small workgroups of users. The Desktop edition will normally index the users PowerPoint presentations and in doing so requires access to the actual file. For that reason, working with large files over low bandwidth connections is not recommended. We therefore suggest that if you are to place presentations on a share, the bandwidth will need to be sufficient so that Slide Executive Desktop is able to get hold of the entire file in a matter of seconds.

To collaborate, using Slide Executive Desktop, we suggest the team places the presentations on a share that all users can access. Each user will then, using their own Desktop edition, index the share and use it to create their own virtual presentations. When another user updates one of the presentations on the share, all the other users that have a Desktop edition pointing to that specific presentation will simply need to do a refresh. Once the library of the presentation is refreshed, all virtual presentations deriving from the presentation on the share will have the latest version.

Slide Executive Professional

When using the Professional edition, bandwidth is not an issue as all the presentations are located on a server. Slide Executive Professional is more of an enterprise content or presentation management system. All the presentations are uploaded to a central document library where everyone, with the appropriate rights, can access it. Slide Executive Professional is entirely web-based and does not require any client installation. The users access the system through their web

browser and there, search and select slides and create new presentations based on the slides gathered.

The Professional edition supports advanced version handling, which increases productivity by enabling virtual presentations to always be up to date.
